HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

DETAILED ACTION

Response to Amendment

The amendment filed 3/30/2009 has been entered into the application file.

Claim Rejections - 35 USC § 103

The rejection of claims 1-5 and 8-9 under 35 U.S.C. 103(a) as being unpatentable over Imahashi et al (US 5,350,643), has been overcome by applicant's amendment to the claims.

Examiner's Amendment

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

The application has been amended as follows:

Change the title to: Fuel cell having a hydrogen electrode catalyst layer porosity that is lower than the air electrode catalyst layer porosity.

Allowable Subject Matter

Claims 1-4 and 8-9 are allowed.

The following is an examiner's statement of reasons for allowance:

The instant claims are to a fuel cell having at least a membrane electrode assembly comprising an electrolyte membrane; a hydrogen electrode-side catalyst layer formed on one side thereof; and an air electrode-side catalyst layer formed on the other side thereof, wherein a porosity of the hydrogen electrode-side catalyst layer is lower than a porosity of the air electrode-side catalyst layer, a volume of pore space of the hydrogen electrode-side catalyst layer has a range of 1.0% to 3.0% of a total volume of the catalyst layer, and a volume of pore space of the air electrode-side catalyst layer has a range of 3% to 30% of the total volume of the catalyst layer, wherein the hydrogen electrode-side catalyst layer contains an additive having an average particle diameter less than or equal to 0.3 μm and the porosity of the hydrogen electrode-side catalyst layer is lower than the porosity of the air electrode-side catalyst layer, and the additive is selected from titanium oxide, zinc oxide, and cerium oxide. The prior art does not teach a fuel cell as claimed.

The most pertinent prior art has been made of record. For example, Imahashi et al (US 5,350,643) teaches a fuel cell having at least a membrane electrode assembly comprising an electrolyte membrane, a hydrogen electrode-side catalyst layer formed on one side thereof, and an air electrode-side catalyst layer formed on the other side thereof, in which the porosity of the hydrogen electrode-side catalyst layer is made to be lower than that of the air electrode-side catalyst layer (claims 1-11, col. 4, line 61 to col. 6, line 54, example 1.) The electrodes include ion-exchange materials to transfer charged ions and water, catalyst for catalyzing the fuel cell reactions that produce electricity, binder for holding the electrode together and a conductive carbon carrier for transferring the electricity. The reference establishes that the conductive carbon carrier increases electrical conductivity, but reduces ionic conductivity in the electrode,

while the ion exchange resin increases ionic conductivity, but reduces electrical conductivity (see cols. 5-6 and examples 1-3.) The amount of ion-exchange resin (taught as a proton conductor in the reference) is greater in the hydrogen electrode than in the oxygen electrode (col. 7, lines 1-15.) Example three discloses using materials having smaller particle sizes for the hydrogen catalyst electrode relative to the oxygen catalyst electrode in order to prepare a hydrogen catalyst electrode having a lower porosity (also see col. 5, lines 1-12.) The particle sizes are adjusted to fill voids in the carbon carrier paper and control the porosity of the electrode (col. 8, lines 50-45.)

The Imahashi reference does not teach the volume of pore space of the hydrogen electrode-side catalyst layer accounts for 1.0% to 3.0% of the total volume of the catalyst layer and the volume of pore space of the air electrode-side catalyst layer accounts for 3% to 30% of the total volume of the catalyst layer. The reference teaches that the pore space of the hydrogen electrode is lower than that of the oxygen electrode (see col. 4, lines 30-40 and col. 6.) Further, Imahashi not teach the invention, as claimed having an additive with an average particle diameter less than or equal to 0.3 μm selected from titanium oxide, zinc oxide, and cerium.

Because the prior art does not disclose the claimed invention or provide teachings that would lead one of ordinary skill in the art at the time the invention was made to find the invention obvious over the prior art, the claims are allowed. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
